What is the difference between block level element and inline element?

A block level element takes up the full width available and always starts on a new line, whereas inline element doesn't start on a new line and only takes up the width required.

Block level elements

	<p>	<h1>-<h6>
<hr>	<section>	<nav>
<form>	<table>	<li>
<ul>	<video>	<article>

Inline elements

<a>	<input>	<img>
<button>	<select>	<label>
		<textarea>
<b>	<i>	<var>

What is viewport meta tag in HTML5

Viewport is the area of a web page that is visible to a user. It varies depending on the device.

A <meta> viewport element gives the browser instructions on how to control the dimensions of the page.

Alright, I want my web page to be refreshed every 5 seconds, how can I achieve this?

You can add

<meta http-equiv="refresh" content="5">

in the <head> section of your web page in order to achieve this.

Okay, I have an <img> tag and I want to add a default fallback image that should be displayed if the specified image could not be found for some reason

We can specify the default image path with onerror attribute of the <img> tag.

```
<img src="Shahbaz.jpg" onerror="this.onerror=null;
this.src='Default.jpg' " alt="profile picture"/>
```

Great! Can you tell me some good html practices for SEO?

Sure...

© www.shahbazkhan.in

- Add meta tag for description of the web page.
- Add keyword meta tag in the head section of the web page.
- Keep only one <h1> tag per page.
- Add language in the html root tag.
- Assign relevant name to a hypertext.
- Add alt attribute in images.
- Follow mobile first approach.
